CAMPUS SUSTAINABILITY: A PRACTICAL GUIDE

RAG Test Document • Sample knowledge base • Version 1.0 • 26 October 2026

1. Purpose and Scope

Campus sustainability means reducing the environmental impact of a university while maintaining a safe, healthy, and effective learning environment. This guide covers waste, water, energy, transport, and the process for reporting facilities problems. It is a fictional test document created for retrieval experiments; the procedures and contact details below are illustrative, not official university policy.

2. Waste Sorting Rules

Paper, clean cardboard, and empty paper packaging belong in the **blue recycling bin**. Food scraps, tea leaves, and fruit peels belong in the **green compost bin** where compost collection is available. Plastic wrappers, contaminated tissues, and mixed-material items that cannot be separated should go into the **grey general-waste bin**. Empty and rinse food containers before recycling them. Batteries and electronic waste must never be placed in ordinary bins; take them to the designated collection point.

3. Water Conservation

A dripping tap can waste water continuously even when the leak looks small. Report leaking taps, running toilets, and damaged drinking-water dispensers to the facilities desk, including the building name, floor, and nearest room number. If a leak is actively flooding a room or creating an electrical hazard, keep away from the affected area and contact campus security immediately rather than waiting for a routine repair.

4. Energy and Room Use

Switch off lights, projectors, and air-conditioning when a room is empty, provided doing so does not interrupt essential equipment or an approved activity. Computer laboratories may have scheduled shutdown procedures; follow the lab supervisor's instructions instead of switching off shared power directly. During hot weather, keep doors and windows closed while air-conditioning is operating, unless ventilation or safety guidance says otherwise.

5. Transport and Bicycle Parking

Walking, cycling, public transport, and shared rides can reduce congestion around campus gates. Bicycles should be locked only to designated racks, not to stair rails, accessible ramps, emergency exits, or fire-safety equipment. A bicycle blocking an accessible route should be reported to security with its location; do not move a bicycle in a way that could cause damage or create a confrontation.

6. Reporting a Facilities Problem

A useful report contains four details: (1) the type of problem, (2) the exact location, (3) when it was noticed, and (4) whether anyone is in immediate danger. For example: “Water is leaking from the ceiling outside Room 214 in the library building; first noticed at 10:20 a.m.; no one appears injured.” Avoid including passwords, student identification numbers, or other unnecessary personal information in a facilities report.

7. Frequently Asked Questions

Q: Where do batteries go? A: Use the designated battery or e-waste collection point; never put batteries in blue, green, or grey ordinary bins. **Q: What should I include when reporting a leak?** A: The building, floor or nearby room, time noticed, and whether flooding or danger is present. **Q: Can I switch off every laboratory computer?** A: No. Follow the lab supervisor's scheduled shutdown procedure.

RAG testing tip: Try direct fact questions, paraphrased questions, questions that combine two sections, and questions whose answers are not stated in this document. The last type checks whether your system correctly says the document does not provide the answer.
